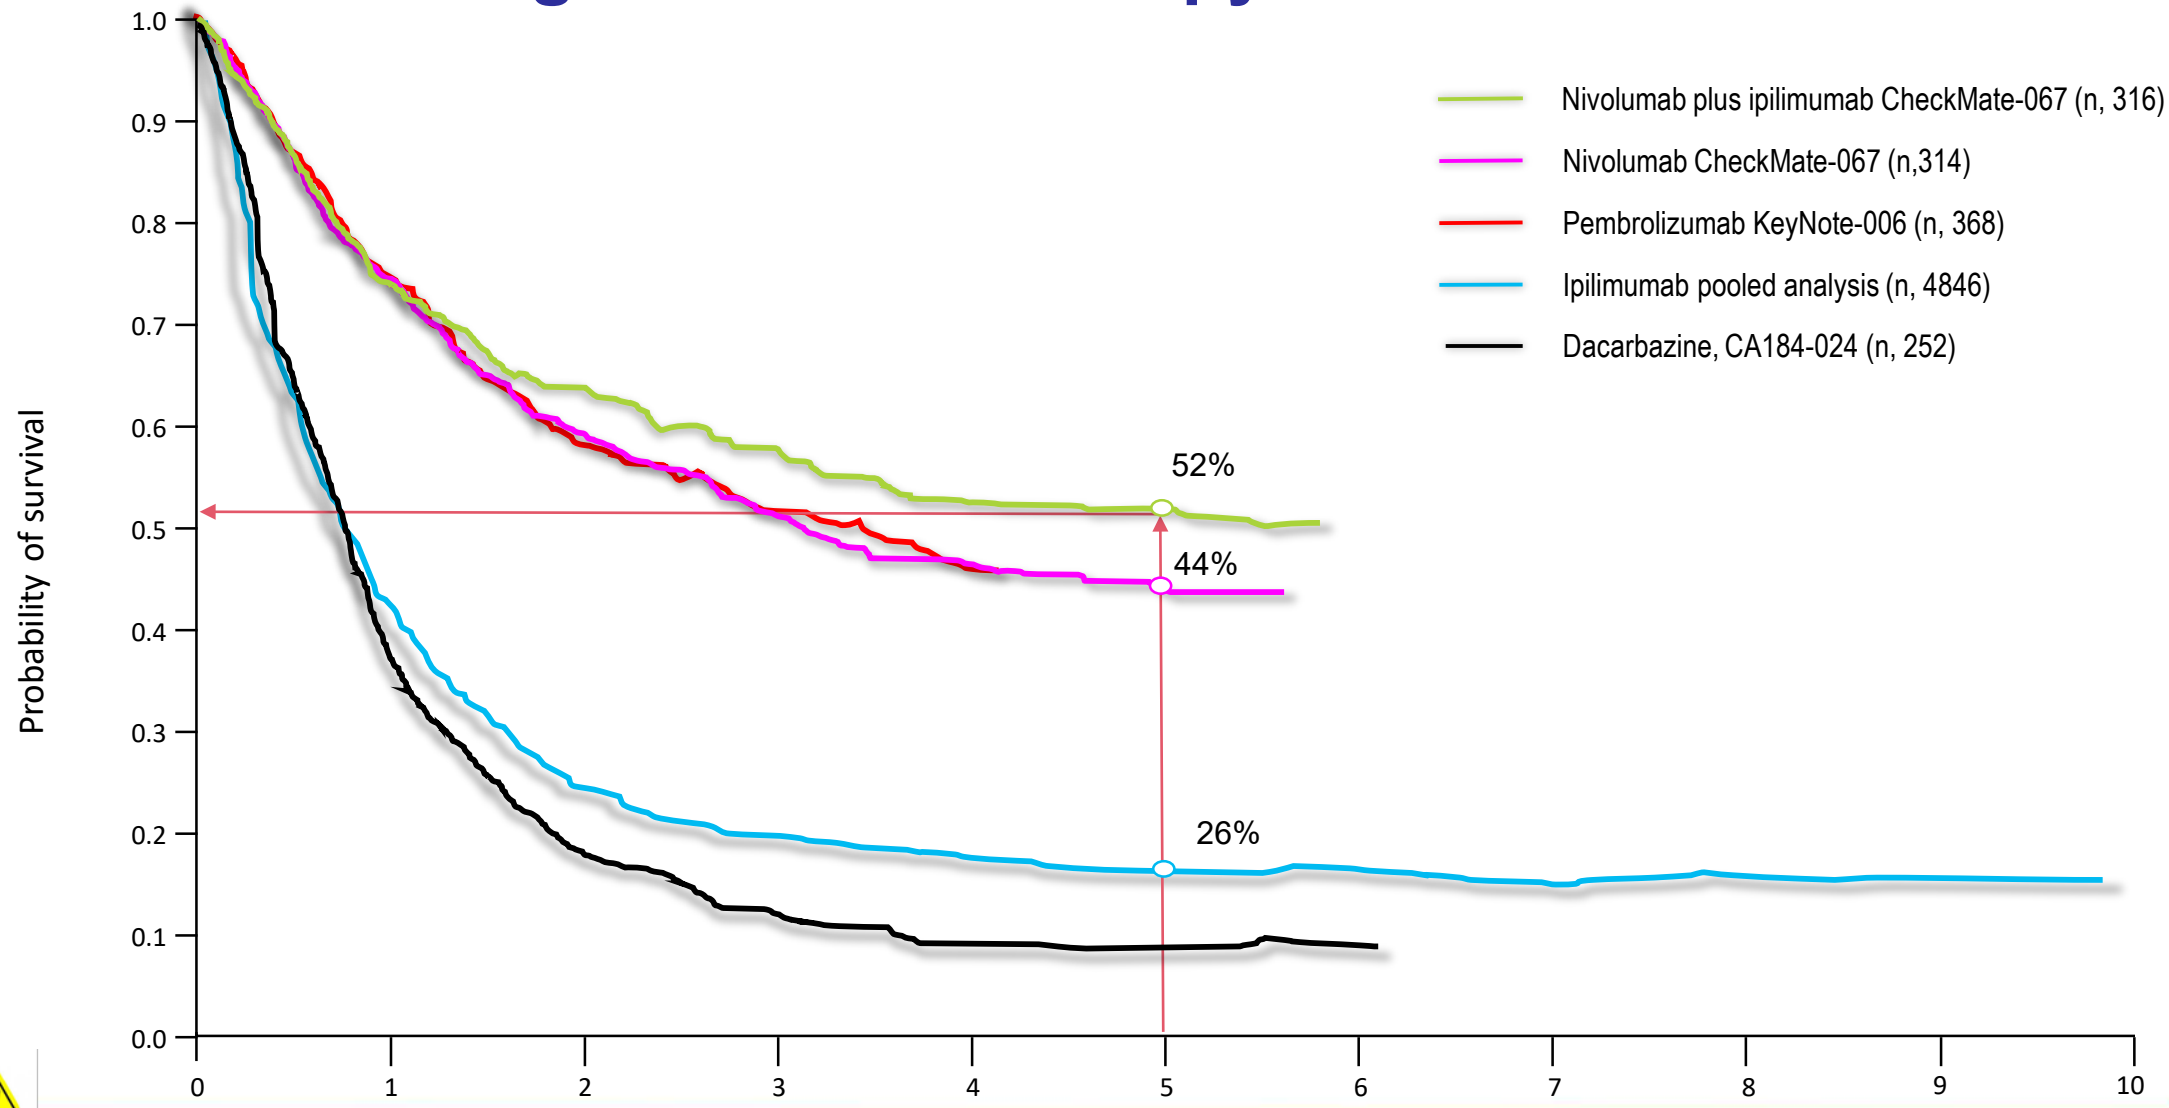
Cross-trial comparison: overall survival of advanced melanoma patients according to first line therapy ICI

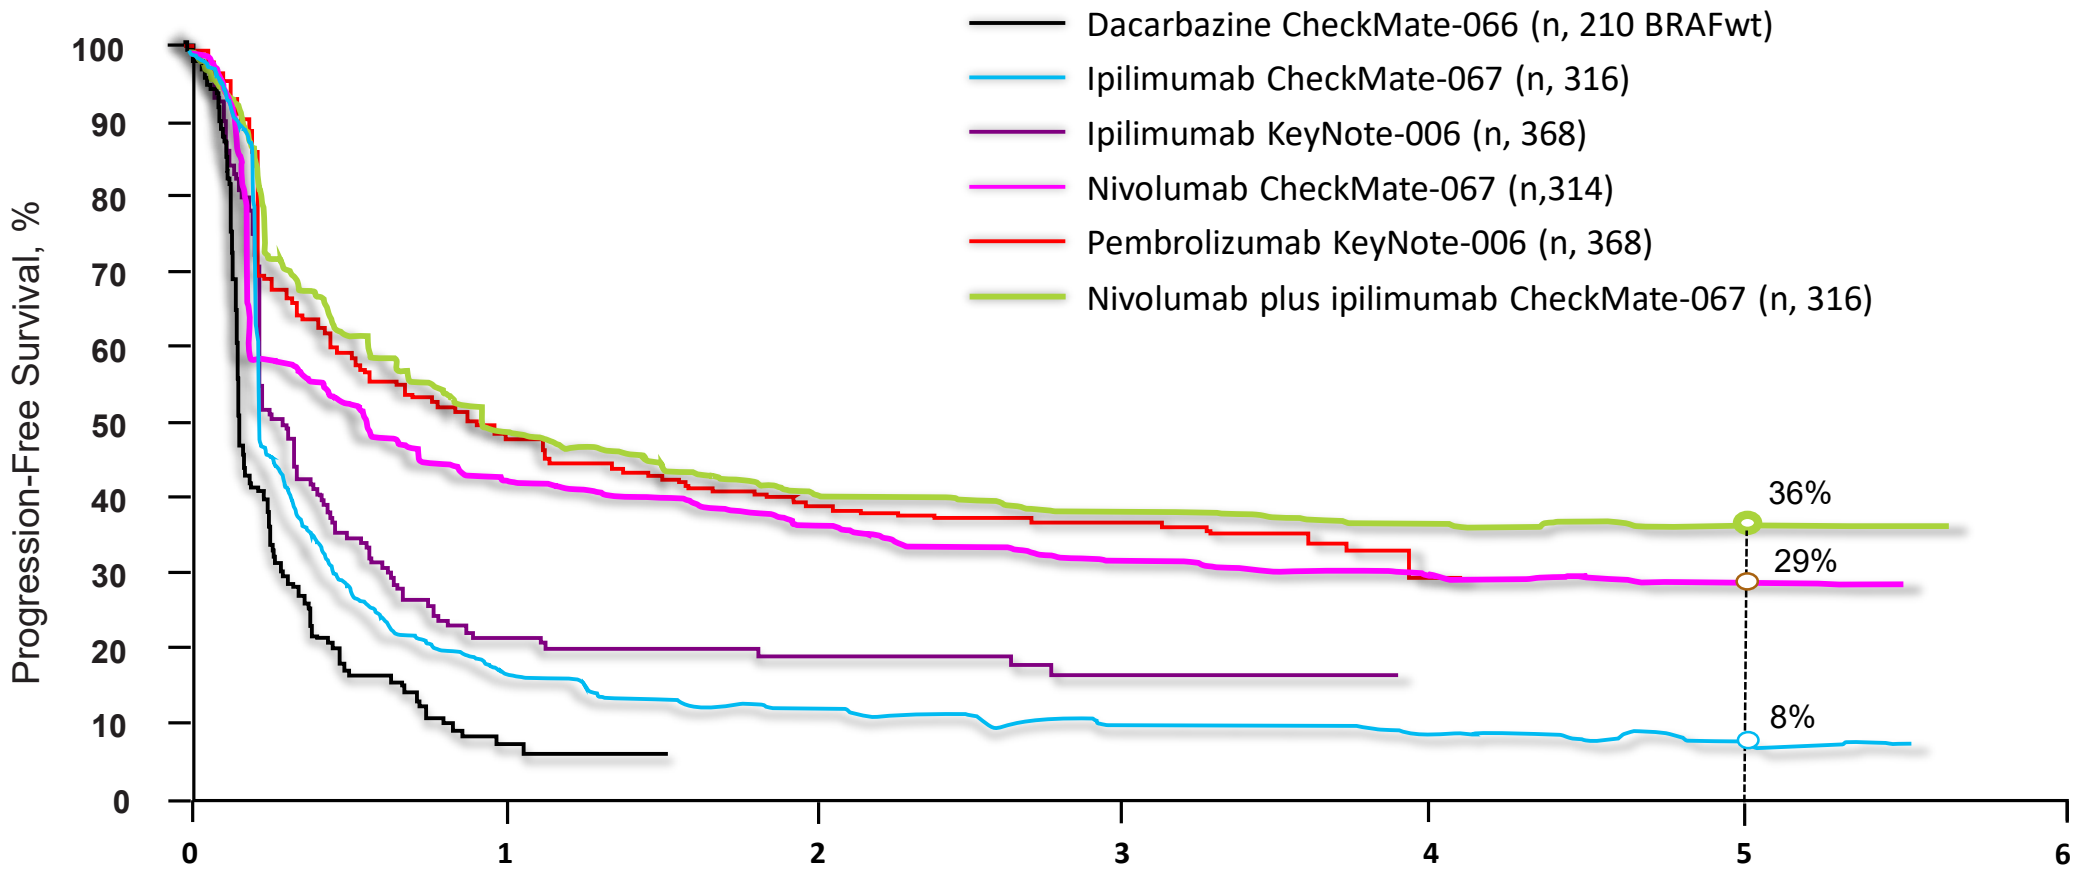


Cross-trial comparison

No adequate well-controlled head-to-head clinical trials are available.

Adapted from Rogiers A.et al. J Oncol. 2019 Apr 28;2019:5269062. doi: 10.1155/2019/5269062

Cross-trial comparison: progression-free survival of advanced melanoma patients on first line ICI therapy



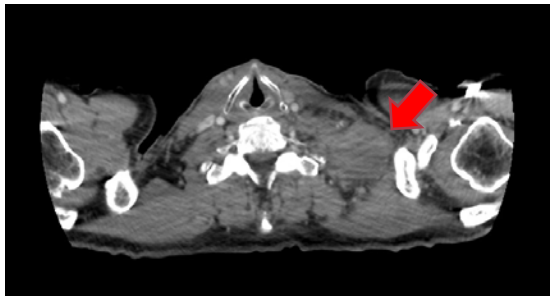
Cross-trial comparison

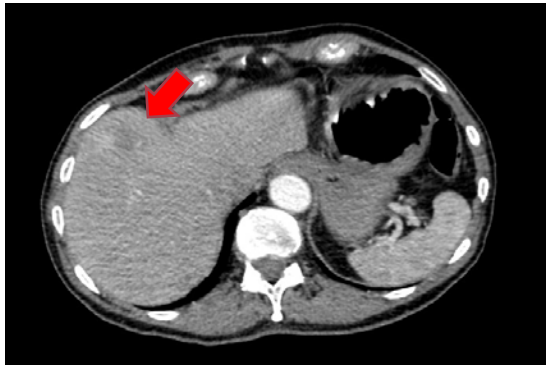
Presented by Prof Neyns at BSMO-Bordet congress on November 28, 2018.

No adequate well-controlled head-to-head clinical trials are available.

Case illustration

Long-term outcome following early discontinuation of pembrolizumab because of an irAE in a 81y old stage IV-M1c BRAFwt melanoma patient





KN006

pembrolizumab

Pooled analysis: nivolumab + ipilimumab in patients who *did* or *did not* discontinue treatment because of AEs during induction

Pooled patients randomly assigned to nivolumab plus ipilimumab (N = 409; 407 treated)
CheckMate 067 (n = 314 randomly assigned; 313 treated)
CheckMate 069 (n = 95 randomly assigned; 94 treated)

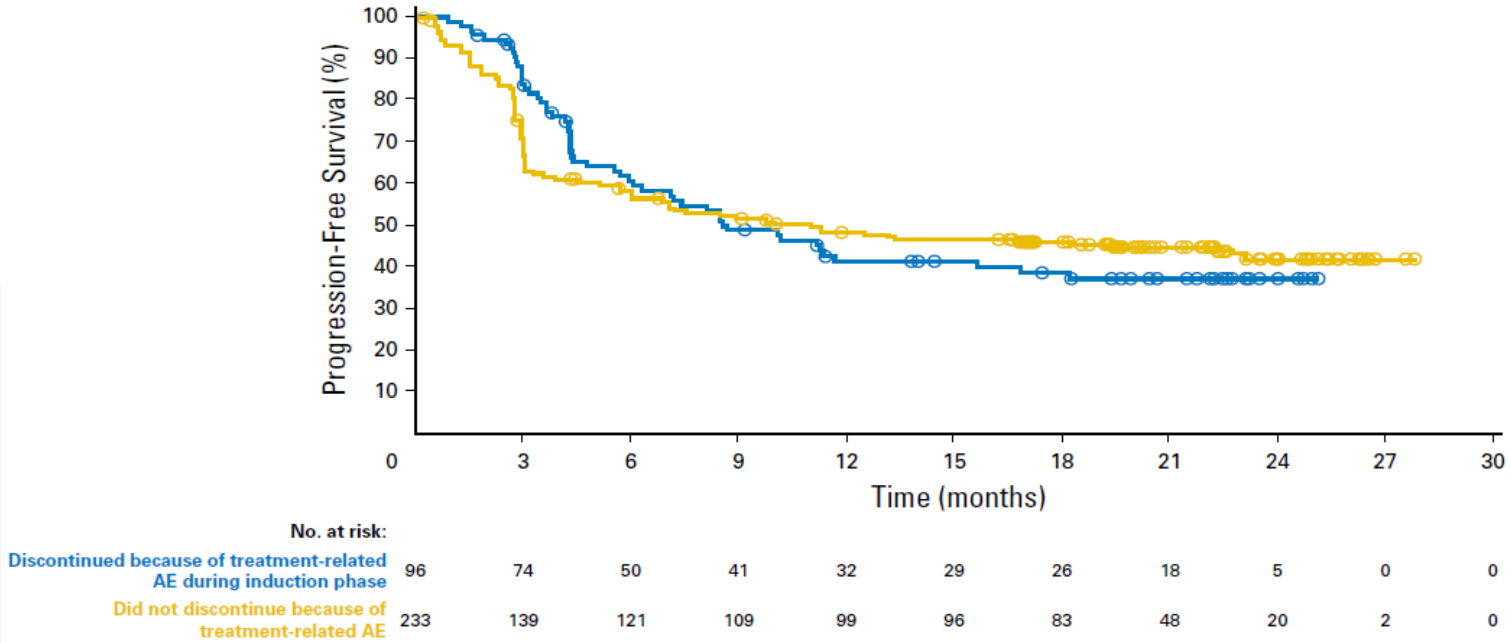
Patients who discontinued because of an AE at any time* (safety analyses; n = 176)

Did not continue study treatment	(n = 176)
Disease progression	(n = 1)
Study drug toxicity	(n = 173)
AE unrelated to study drug	(n = 1)
Not reported	(n = 1)

Patients who discontinued because of an AE during the induction phase† (efficacy analyses; n = 96)

Treated patients who did not discontinue because of an AE (n = 231)

Did not continue study treatment	(n = 150)
Disease progression	(n = 97)
Study drug toxicity	(n = 1)
Death	(n = 4)
AE unrelated to study drug	(n = 18)
Patient request	(n = 14)
Withdrew consent	(n = 4)
Maximum clinical benefit	(n = 7)
Poor/noncompliance	(n = 1)
No longer met study criteria	(n = 1)
Other	(n = 3)



Minimum 18-month follow-up, median 21.3-month follow-up

Reproduced from Schadendorf D et al. *J Clin Oncol.* 2017;35:3807-3814

AE = adverse event; CI = confidence interval; DC = patients who discontinued due to an AE during induction; HR = hazard ratio; IPI = ipilimumab; NIVO = nivolumab; no DC = patients who did not discontinue due to an AE; PFS = progression-free survival.

Reproduced from Schadendorf D et al. *J Clin Oncol.* 2017;35:3807-3814

Outcome of advanced melanoma patients stopping treatment in the absence of disease progression

	Study	Patient #	Reason for stopping therapy	FU post treatments stop (months)	PFS%
PD-1 inhibitor	Phase I Nivolumab[6]	17	Other than PD during response	≥ 4	71%
	Phase I Pembrolizumab (Keynote-001)[1]	67	Confirmed CR	10	97%
	Phase III Pembrolizumab (Keynote-006)[2]	103	After 2 years of therapy (protocol defined)	34.2	78.4%
	anti-PD1-Real World[3]	185	Other than PD or AE	18	78%
BRAF-/MEK-inhibitors	Cohort-study[4]	12	Other than PD	6.6	50%
	Cohort-study[5]	12	Other than PD	3	50%

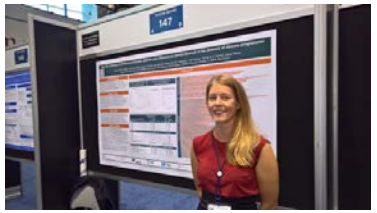
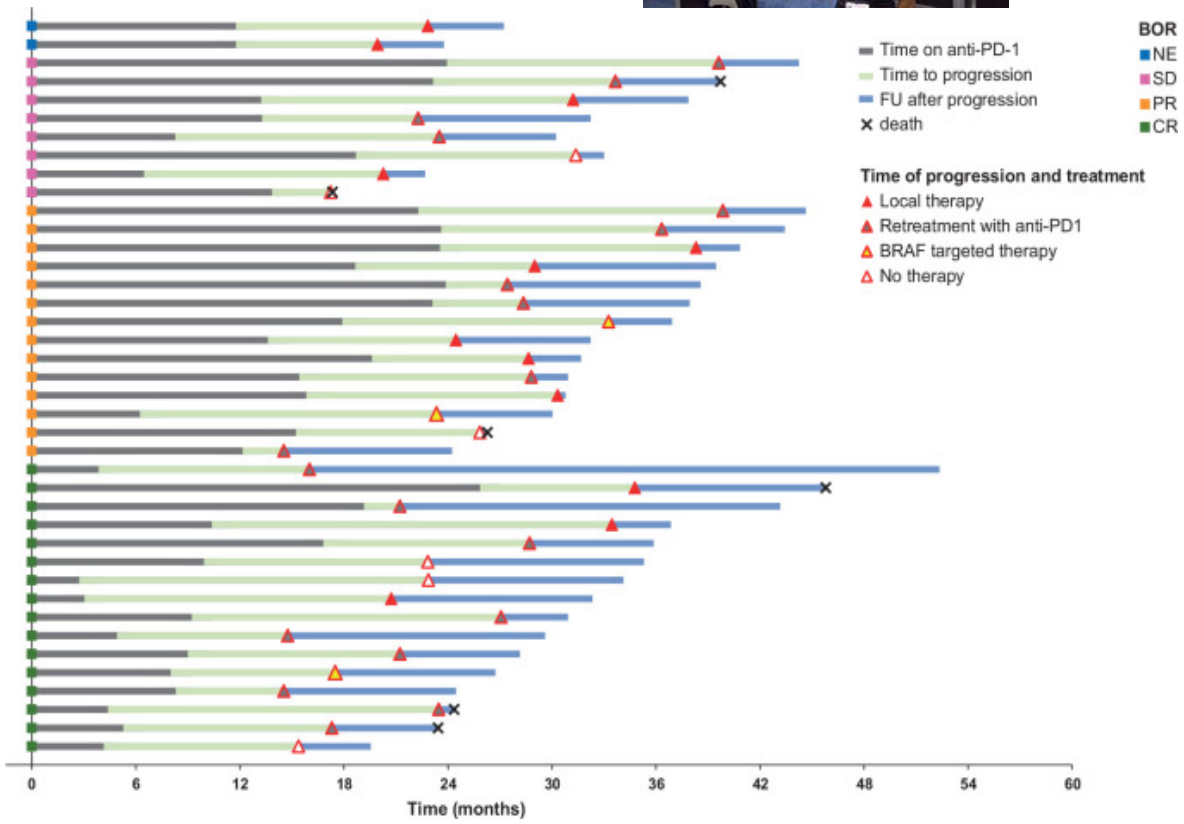
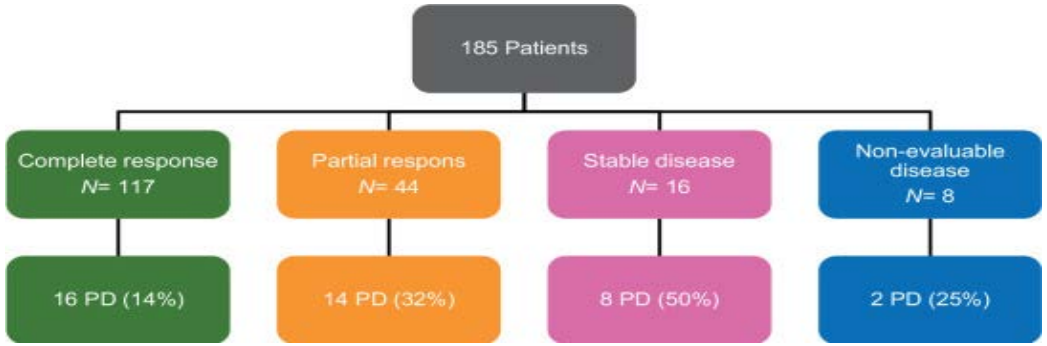
Real life data from advanced melanoma pts discontinuing anti-PD1 in the absence of PD or treatment limiting toxicity at 14 hospitals across Europe and Australia

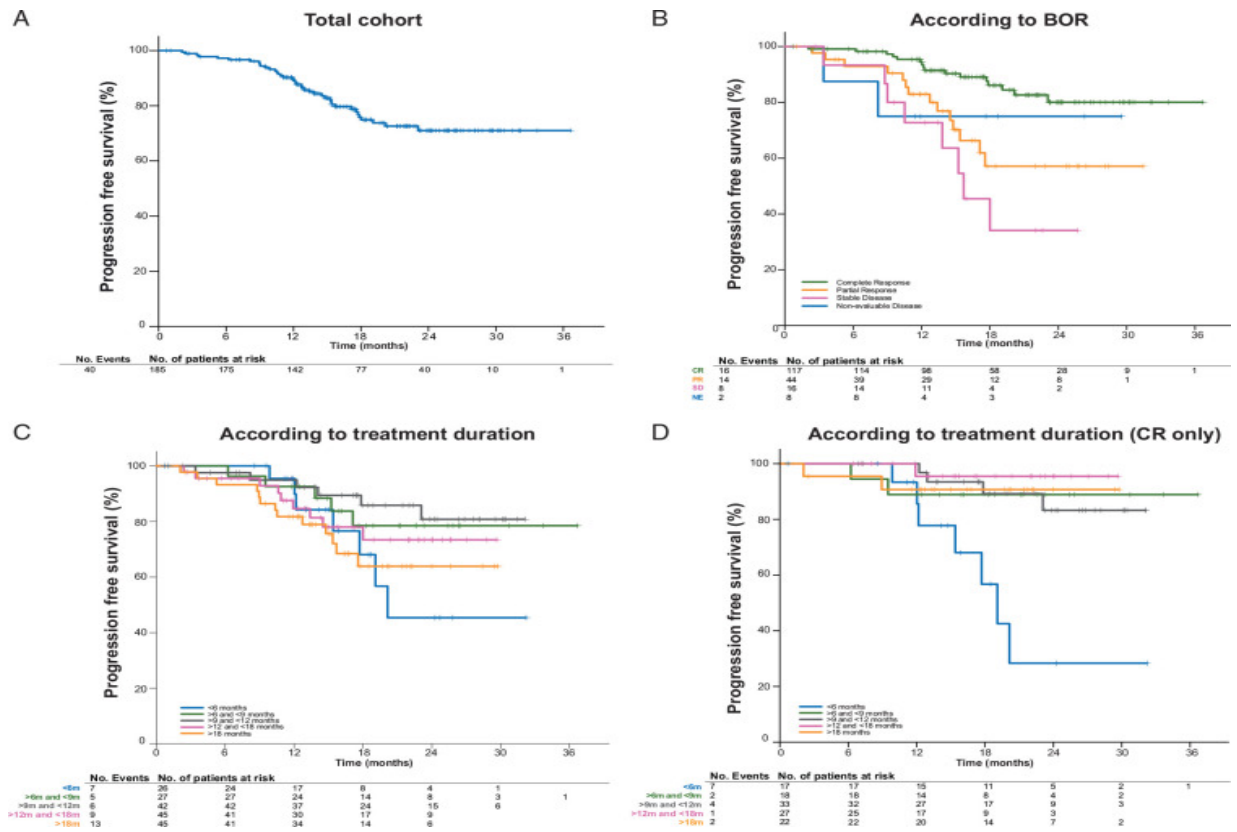






Outcome of 185 patients discontinuing treatment according to BOR and outcome after PD-1 reintroduction. Of the 185 patients who discontinued anti-PD-1, 40 patients experienced progressive disease. A PD-1 inhibitor was re-introduced in 19 patients leading to 6 renewed objective responses (32%, two patients with a CR [11%] and four patients with a PR [21%]). Abbreviations: PD-1, Programmed cell death protein 1; CR, complete response; PR, partial response; SD, stable disease; NE, non-evaluable disease; PD, progressive disease; BOR, best objective response.

Elective discontinuation should only be considered after a minimum of 6 months of treatment duration



Kaplan–Meier probability curves for progression-free survival from discontinuation of anti-PD-1. Progression free survival from discontinuation of anti-PD-1 for the total cohort that discontinued in the absence of PD or TLT (A); according to best overall (B) and according to time on anti-PD-1 therapy for the whole cohort (C) and only for patients with a CR (D). The hash marks designate patients who were censored at that time point. Abbreviations: PD-1, programmed cell death protein 1; BOR, best overall response; PD, progressive disease; TLT, treatment limiting toxicity.

Recommendation 6.1. Patients with a CR that persists at the following radiological evaluation (at least 4 weeks after), and who have received at least 6 months of anti-PD-1 treatment, can be considered for stopping therapy.

Recommendation 6.2. Stopping treatment with anti-PD-1 therapy should be considered after 2 years of treatment in the case of PR.

Recommendation 6.3. Stopping treatment with anti-PD-1 therapy can be considered after 2 years of treatment in the case of SD.

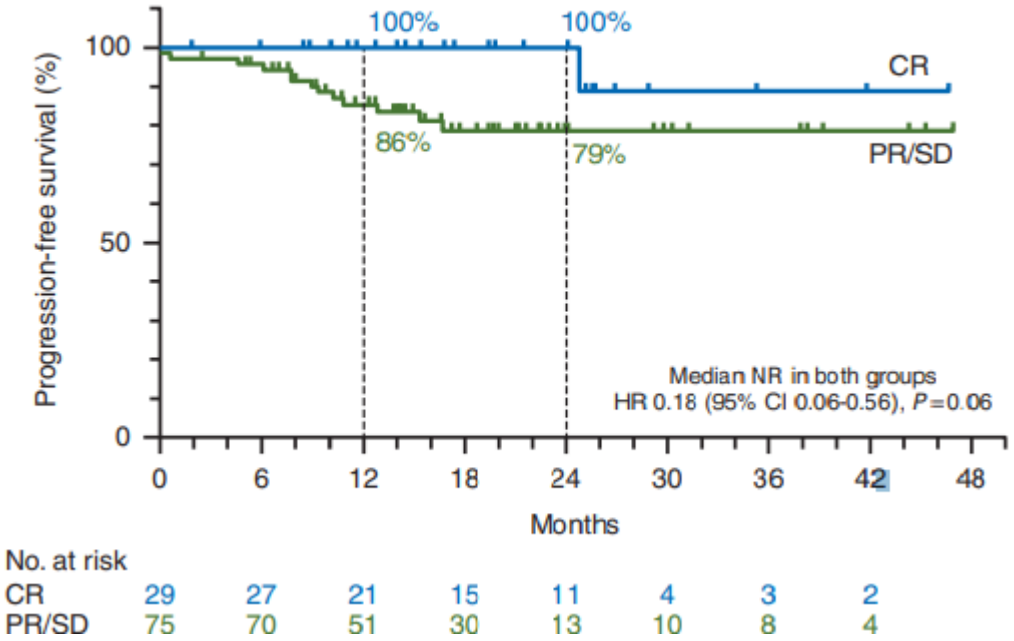
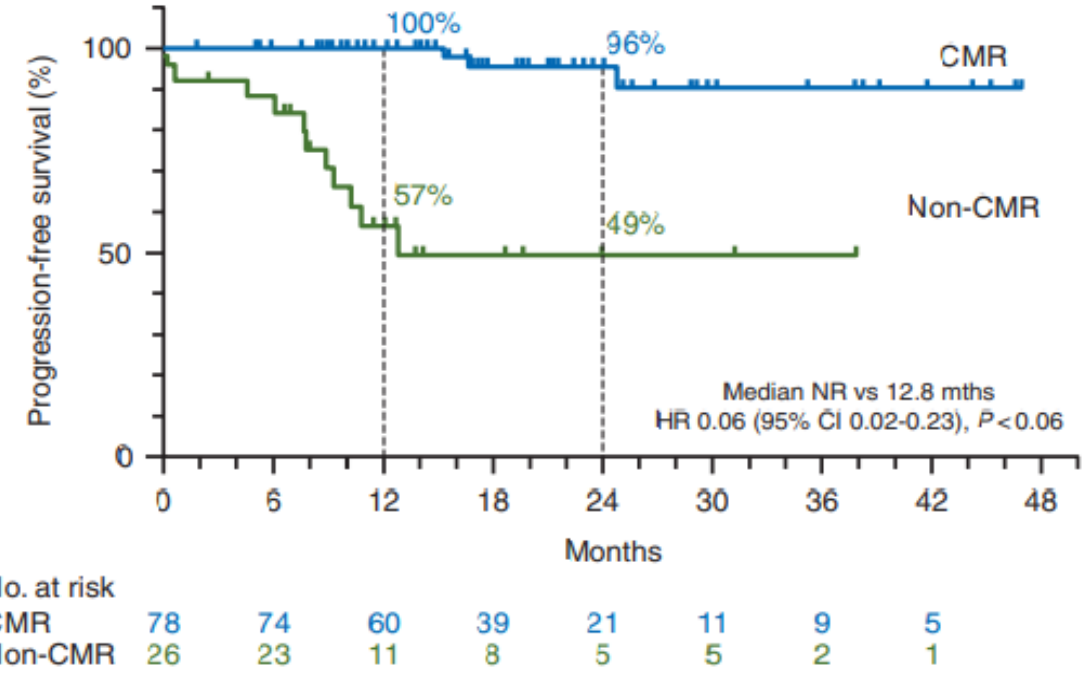
FDG-PET of value in predicting long-term outcomes ?

Progression free survival post 1-year imaging by CT response



Progression free survival post 1-year imaging by PET response



- RECIST PFS post 1-year landmark was similar in patients with CR vs PR/SD, but improved in patients with CMR vs non-CMR In the 78 CMR patients, 78% had discontinued treatment and 96% had ongoing response.
- In patients with PR on CT, PFS was improved in patients with PR+CMR vs PR+non-CMR (median NR vs 12.8 months; HR 0.07 [95% CI 0.02-0.27]; p<0.01)

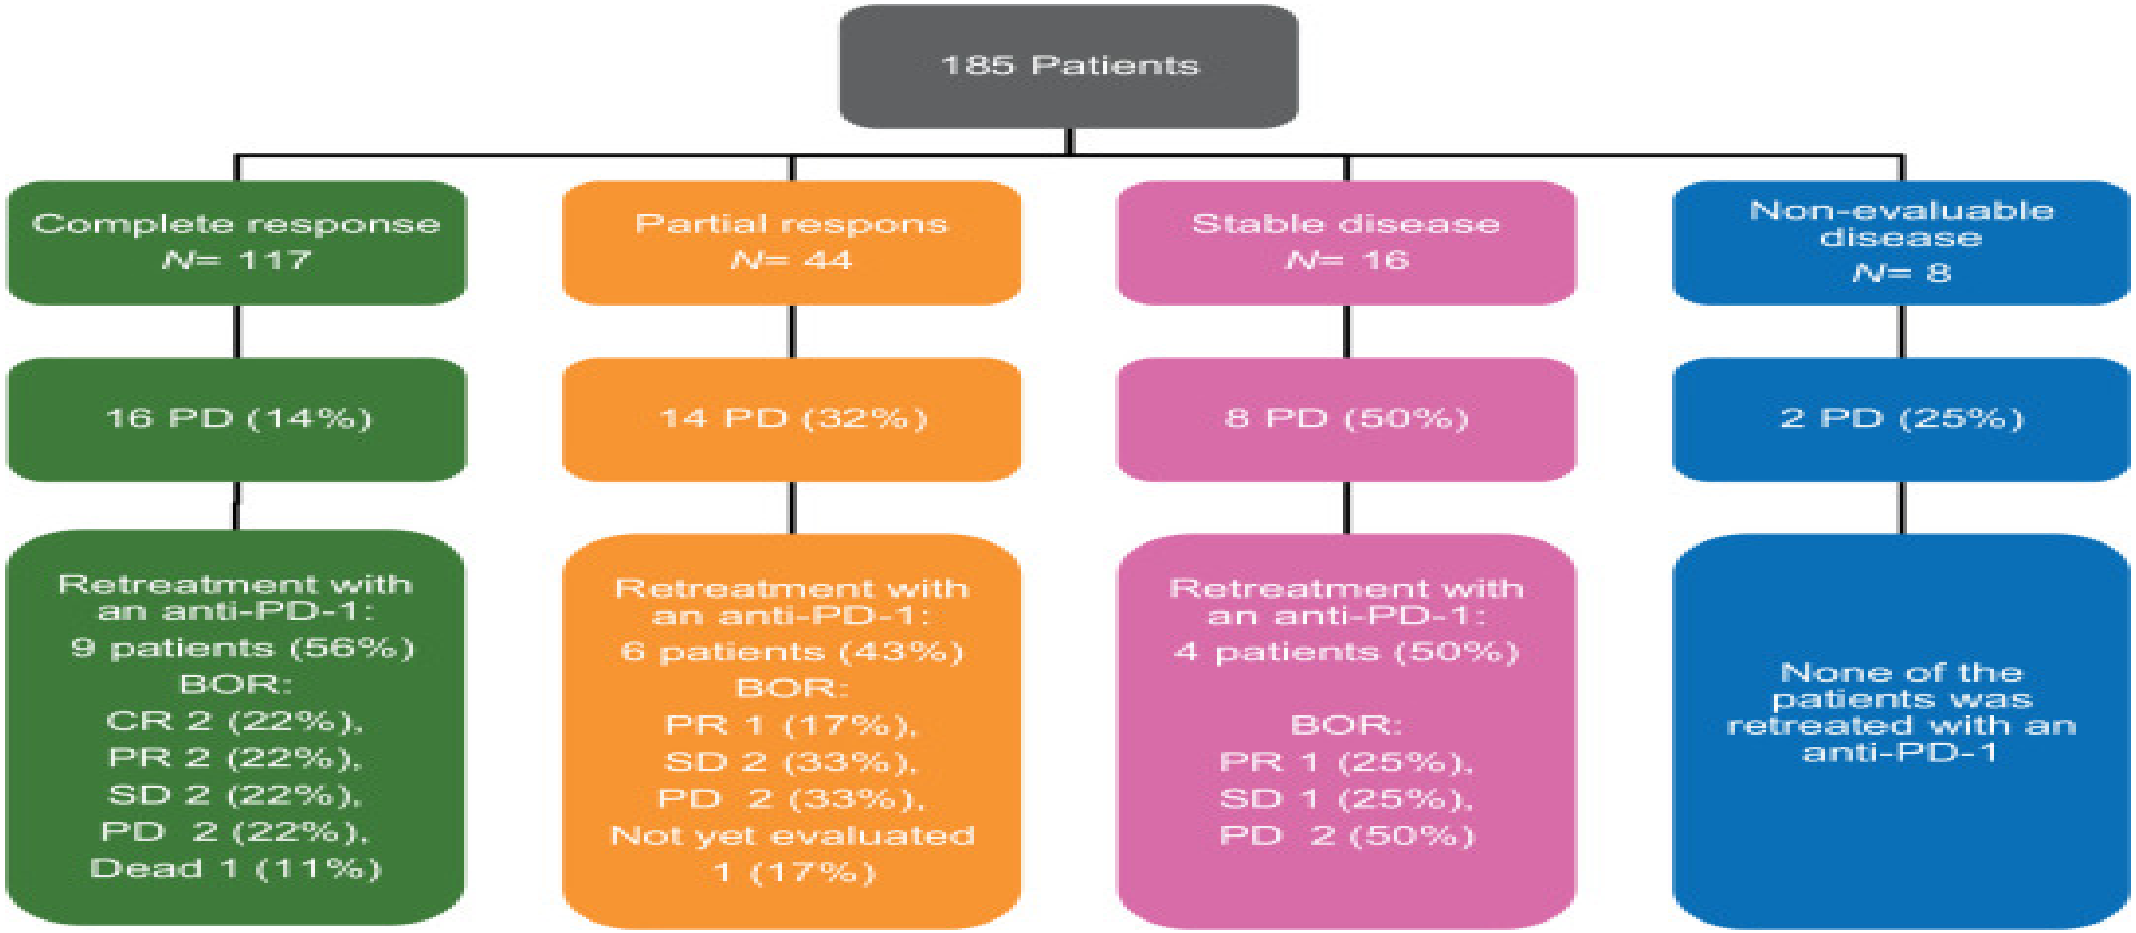
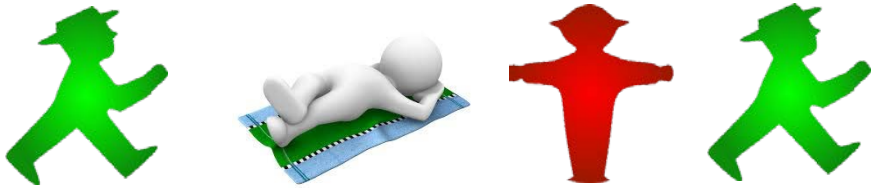
Clinical outcome of advanced melanoma patients after discontinuation of an anti-PD-1 in the absence of disease progression or treatment limiting toxicity



Outcome of 185 patients discontinuing treatment according to BOR and outcome after PD-1 reintroduction. Of the 185 patients who discontinued anti-PD-1, 40 patients experienced progressive disease. A PD-1 inhibitor was re-introduced in 19 patients leading to 6 renewed objective responses (32%, two patients with a CR [11%] and four patients with a PR [21%]). Abbreviations: PD-1, Programmed cell death protein 1; CR, complete response; PR, partial response; SD, stable disease; NE, non-evaluable disease; PD, progressive disease; BOR, best objective response.

Melanoma: when to stop immunotherapy?



- Stopping anti-PD1 immunotherapy my be considered in advanced melanoma patients who benefit from therapy and do not experience treatment limiting toxicities with an acceptable low risk for progression within the first 3 years following treatment discontinuation
- The optimal duration of aPD-1 has not been established and may vary between patients
  - Largest body of evidence relates to an arbitrary treatment duration of 2y (KN006)
  - Real world data support shorter duration of therapy as equally safe with respect to PFS
  - CR on CT can be used as a main driver in decision making (KN001)
  - PET/CT after 1y of therapy can aid decision making in patients with PR and CMR
- Rather than prospective trials investigating arbitrary duration of therapy, predictive algorithms incorporating baseline clinical and tissue biomarkers and on-therapy response characteristics (PET/CT) may allow us to make individualized decisions on optimal treatment duration
- Retreatment at the time of PD following elective treatment discontinuation has demonstrated activity in small case series and should be considered @PD following elective discontinuation

Back-Up slides

Outcome of patients after retreatment with anti-PD-1therapy

Patient	Time on anti-PD-1 (months)	BOR 1st course anti-PD-1	Time to PD (months)	Therapy for PD	BOR 2nd course anti-PD-1	Disease status at time data cut-off
