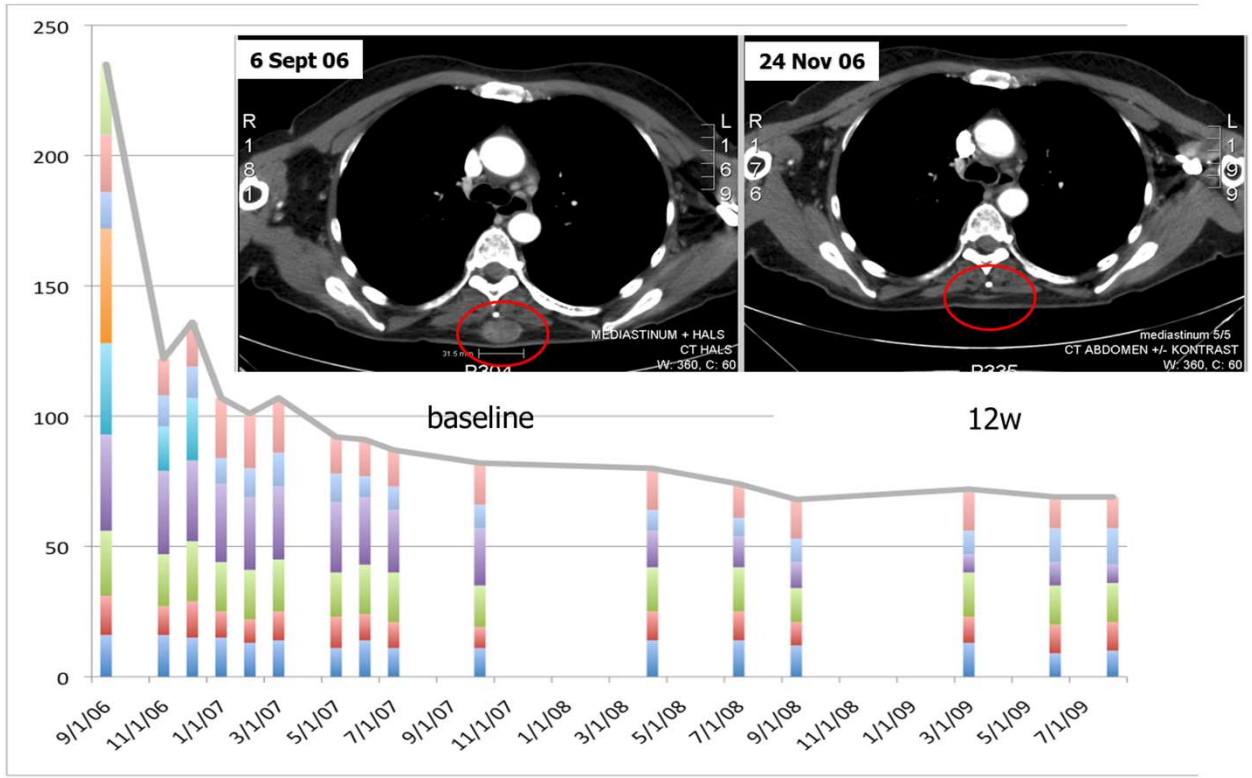
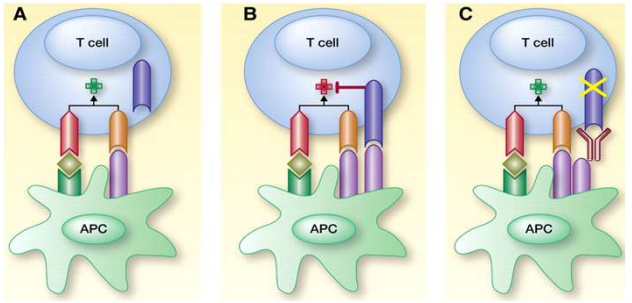
Ipilimumab monotherapy in patients with pretreated advanced melanoma: a randomised, double-blind, multicentre, phase 2, dose-ranging study

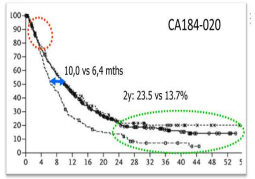
Jedd D Wolchok, Bart Neyns, Gerald Linette, Sylvie Negrier, Jose Lutzky, Luc Thomas, William Waterfield, Dirk Schadendorf, Michael Smylie, Troy Guthrie Jr, Jean-Jacques Grob, Jason Chesney, Kevin Chin, Kun Chen, Axel Hoos, Steven J O'Day, Celeste Lebbé

Lancet Oncol 2010; 11: 155–64

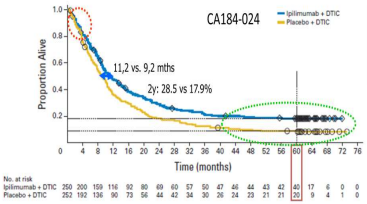




Overall survival following treatment with ipilimumab in Phase III Clinical Trials



- Ipilimumab, 3 mg/kg Q3w x4
- Patients without PD or TLT @w24 were offered additional courses of therapy (re-induction) if they had PD
- BORR = 6/31 (19.3%) re-induction-eligible patients; DCR 70%



- DTIC + placebo or ipilimumab (10 mg/kg, Q3w x4)
- Patients without PD or LT @6mths could receive ipilimumab or placebo maintenance therapy (Q12w beginning @w24)

Recommendation 6.1. Patients with a CR that persists at the following radiological evaluation (at least 4 weeks after), and who have received at least 6 months of anti-PD-1 treatment, can be considered for stopping therapy.

Recommendation 6.2. Stopping treatment with anti-PD-1 therapy should be considered after 2 years of treatment in the case of PR.

Recommendation 6.3. Stopping treatment with anti-PD-1 therapy can be considered after 2 years of treatment in the case of SD.

MELANOMA (DB JOHNSON, SECTION EDITOR)

Anti-PD-1: When to Stop Treatment

Y. Jansen[1] · A. A. M. van der Veldt[2] · G. Awada[3] · B. Neyns[3]

Accepted: 28 January 2022

Future: Prospective Data

- The Dutch Safe stop trial (Trial NL7293) will evaluate the rate of ongoing response in the patients with advanced melanoma who discontinue first-line monotherapy with nivolumab or pembrolizumab upon achieving CR or PR according to RECIST. The patients are required to obtain a confirmed PR/CR before treatment discontinuation.
- The Canadian STOP-GAP study (NCT02821013) is designed to randomize patients between standard of care (treatment to 2 years) and discontinuation after confirmed maximum tumor response. The results are expected in 2029.
- The Dante trial is a multicenter, randomized, phase III, non-inferiority trial. Patients will be randomized at 12 months to continue anti-PD-1 for 2 years or discontinue independent of response at randomization.

PD-1, programmed death-1.

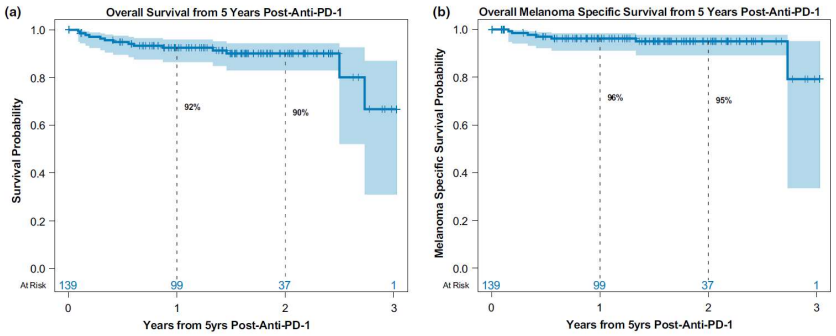
SHORT COMMUNICATION

WILEY

Beyond the 5-year milestone: Long-term survivorship of melanoma patients treated off-trial with anti-PD-1

Kimberly Loo[1,2] | Hannah L. Kalvin[3] | Katherine S. Panageas[3] | Margaret K. Callahan[1,4] | Paul B. Chapman[1,4] | Parisa Momtaz[1,4] | Alexander N. Shoushtari[1,4] | Jedd D. Wolchok[1,4] | Michael A. Postow[1,4] | Allison Betof Warner[1,4]



Patients treated with anti-PD-1 regimens off clinical trials who survive at least 5 years from initial anti-PD-1 treatment can be reassured of their excellent long-term prognosis, particularly if they did not require additional melanoma treatment during the first 5 years.

PD-1, programmed death-1; y, year.

Efficacy and Safety Outcomes in Patients With Advanced Melanoma Who Discontinued Treatment With Nivolumab and Ipilimumab Because of Adverse Events: A Pooled Analysis of Randomized Phase II and III Trials

Dirk Schadendorf, Jedd D. Wolchok, F. Stephen Hodi, Vanna Chiarion-Sileni, Rene Gonzalez, Piotr Rutkowski, Jean-Jacques Grob, C. Lance Cowey, Christopher D. Lao, Jason Chesney, Caroline Robert, Kenneth Grossmann, David McDermott, Dana Walker, Rafia Bhore, James Larkin, and Michael A. Postow

- Approximately 40% of patients with advanced melanoma who received nivolumab + ipilimumab in clinical trials discontinued treatment because of AEs
- Patients who discontinued treatment at any time because of an AE were less likely to have an elevated LDH level (27% v 39%) or M1c disease (49% v 61%) compared with the patients who did not discontinue.
- Data were pooled from phase II and III trials of patients who received nivolumab 1 mg/kg plus ipilimumab 3 mg/kg, Q3w x4, followed by nivolumab monotherapy 3 mg/kg Q2w (N = 409)
- Efficacy was assessed in all randomly assigned patients who discontinued because of AEs during the induction phase (n = 96) and in those who did not discontinue because of AEs (n = 233)
- The objective response rate was 58.3% for patients who discontinued because of AEs during the induction phase and 50.2% for patients who did not discontinue
- 64% of patients who ceased treatment during induction for AEs had an ongoing response compared with 80% of those who did not cease therapy for an AE
- At > 18 mths of follow-up, median PFS was 8.4 months for pts who discontinued treatment because of AEs during the induction phase and 10.8 mths for pts who did not discontinue because of AEs (P = .97)
- Median overall survival had not been reached in either group (P = .23).

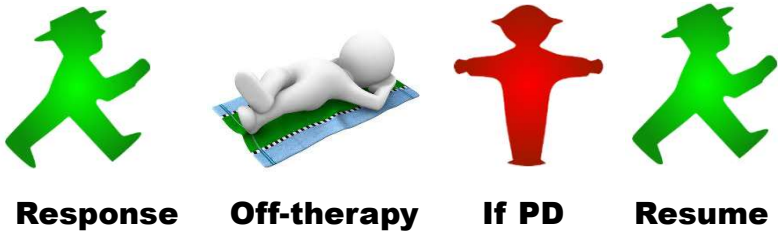
Melanoma: when to stop immuno-therapy?



- Anti-PD-1 immunotherapy can be stopped in advanced melanoma patients who benefit from therapy and do not experience treatment limiting toxicities with an acceptable low risk for progression
- The optimal duration of aPD-1 mono-therapy has not been established prospectively and may vary between individual patients
  - Largest body of evidence relates to an arbitrary treatment duration of 2y (KN006)
  - Real-world data support shorter duration of therapy (ESMO guideline)
  - CR on CT can be used as a main driver in decision making
  - CMR on [18F] FDG-PET response seems most useful to aid decision making
- Retreatment at the time of PD following elective treatment discontinuation has demonstrated activity in small case series and can be considered @PD following elective discontinuation

"I offered to help my consulting physician to raise funds, not for myself, but for others like me."

VUB-UZB PAUL DE KNOP FUND

Shortly after the end of his mandate as rector of Vrije Universiteit Brussel prof. Paul De Knop was diagnosed with (metastised) melanoma; still today one of the most aggressive forms of cancer. During his treatment at UZ Brussel he came in contact with Prof. Bart Neyns and his research team. His experimental treatment, i.e. immunotherapy, has shown promising results but requires additional research to help more people, in a quicker and more affordable way out of their penile situation.
